

nag_trans_hessenberg_controller (g13exc)

1. Purpose

nag_trans_hessenberg_controller (g13exc) reduces the matrix pair (B,A) to lower or upper controller Hessenberg form using (and optionally accumulating) the unitary state-space transformations.

2. Specification

```
#include <nag.h>
#include <nagg13.h>

void g13exc(Integer n, Integer m, Nag_ControllerForm reduceto, double a[],
            Integer tda, double b[], Integer tdb, double u[], Integer tdu,
            NagError *fail)
```

3. Description

The function computes a unitary state-space transformation U , which reduces the matrix pair (B,A) to give a compound matrix in one of the following controller Hessenberg forms:

$$(UB|UAU^T) = \begin{pmatrix} \begin{matrix} & & m & & \\ * & \cdot & \cdot & \cdot & * \\ & \cdot & & & \cdot \\ & & \cdot & & \cdot \\ & & & \cdot & \cdot \\ & & & & * \\ & & & & \cdot \\ & & & & * \\ & & & & \cdot \\ & & & & \cdot \\ & & & & * \\ & & & & \cdot \\ & & & & \cdot \\ & & & & * \end{matrix} & \begin{matrix} & & n & & \\ * & \cdot & \cdot & \cdot & \cdot & \cdot & \cdot & \cdot & * \\ & \cdot & & & \cdot & & & & \cdot \\ & & \cdot & & \cdot & & & & \cdot \\ & & & \cdot & \cdot & & & & \cdot \\ & & & & * & & & & \cdot \\ & & & & \cdot & & & & \cdot \\ & & & & \cdot & & & & \cdot \\ & & & & \cdot & & & & \cdot \\ & & & & \cdot & & & & \cdot \\ & & & & * & & & & \cdot \\ & & & & \cdot & & & & \cdot \\ & & & & \cdot & & & & \cdot \\ & & & & * & & & & \cdot \\ & & & & \cdot & & & & \cdot \\ & & & & \cdot & & & & * \end{matrix} \\ \hline & n \end{pmatrix}$$

if **reduceto** = **Nag_UH_Controller**, or

$$(UAU^T|UB) = \begin{pmatrix} \begin{matrix} & & n & & \\ * & \cdot & \cdot & \cdot & * \\ & \cdot & & & \cdot \\ & & \cdot & & \cdot \\ & & & \cdot & \cdot \\ & & & & * \\ & & & & \cdot \\ & & & & \cdot \\ & & & & \cdot \\ & & & & \cdot \\ & & & & * \\ & & & & \cdot \\ & & & & \cdot \\ & & & & * \end{matrix} & \begin{matrix} & & m & & \\ * & \cdot & \cdot & \cdot & \cdot & \cdot & \cdot & \cdot & * \\ & \cdot & & & \cdot & & & & \cdot \\ & & \cdot & & \cdot & & & & \cdot \\ & & & \cdot & \cdot & & & & \cdot \\ & & & & * & & & & \cdot \\ & & & & \cdot & & & & \cdot \\ & & & & \cdot & & & & \cdot \\ & & & & \cdot & & & & \cdot \\ & & & & * & & & & \cdot \\ & & & & \cdot & & & & \cdot \\ & & & & \cdot & & & & * \end{matrix} \\ \hline & n \end{pmatrix}$$

if **reduceto** = **Nag_LH_Controller**.

If $m > n$, then the matrix UB is trapezoidal and if $m + 1 \geq n$ then the matrix UAU^T is full.

4. Parameters

n

Input: The actual state dimension, n , i.e., the order of the matrix A .

Constraint: $n \geq 1$.

m

Input: The actual input dimension, m .

Constraint: $m \geq 1$.

reduceto

Input: Indicates whether the matrix pair (B,A) is to be reduced to upper or lower controller Hessenberg form as follows:

reduceto = **Nag_UH_Controller**, (Upper controller Hessenberg form);

reduceto = **Nag_LH_Controller**, (Lower controller Hessenberg form).

a[n][tda]

Input: The leading n by n part of this array must contain the state transition matrix A to be transformed.

Output: The leading n by n part of this array contains the transformed state transition matrix UAU^T .

tda

Input: The trailing dimension of array **a** as declared in the calling program.

Constraint: **tda** $\geq n$.

b[n][tdb]

Input: The leading n by m part of this array must contain the input matrix B to be transformed.

Output: The leading n by m part of this array contains the transformed input matrix UB .

tdb

Input: The trailing dimension of array **b** as declared in the calling program.

Constraint: **tdb** $\geq m$.

u[n][tdu]

Input: If **u** is defined, then the leading n by n part of this array must contain either a transformation matrix (e.g. from a previous call to this function) or be initialised as the identity matrix. If this information is not to be input then **u** must be set to the null pointer, i.e., (double *)0.

Output: If **u** is defined, then the leading n by n part of this array contains the product of the input matrix U and the state-space transformation matrix which reduces the given pair to observer Hessenberg form.

tdu

Input: The trailing dimension of array **u** as declared in the calling program.

Constraint: **tdu** $\geq n$ if **u** is defined.

fail

The NAG error parameter, see the Essential Introduction to the NAG C Library.

5. Error Indications and Warnings

NE_BAD_PARAM

On entry parameter **reduceto** had an illegal value.

NE_INT_ARG_LT

On entry, **n** must not be less than 1: **n** = *<value>*.

On entry, **m** must not be less than 1: **m** = *<value>*.

NE_2_INT_ARG_LT

On entry **tda** = *<value>* while **n** = *<value>*.

These parameters must satisfy **tda** \geq **n**.

On entry **tdb** = *<value>* while **m** = *<value>*.

These parameters must satisfy **tdb** \geq **m**.

On entry **tdu** = *<value>* while **n** = *<value>*.

These parameters must satisfy **tdu** \geq **n**.

6. Further Comments

The algorithm requires $O((n+m)n^2)$ operations (see Van Dooren and Verhaegen 1985).

6.1. Accuracy

The algorithm is backward stable.

6.2. References
